

THE TEMPORAL LIFT

Dr Bryan Mendelson

Increasingly, people who are concerned about their appearance are seeking to correct the early ageing changes around the outer eyelid area. To combat the onset of 'smile' lines, advanced plastic surgery achieves a natural and refreshed look to the outer eyelid area, unlike the all too 'obvious' skin pull procedure. Recent, major advances in understanding the anatomy of the support layer beneath the skin of the cheek and outer eyelid area have resulted in significant changes to treatment.

Temporal Lift surgery is concealed within the temple hair, and is carried out without losing hair or scarring the face. The look is intrinsically lasting and is achieved by tightening the internal ligaments which support the outer brow, corner of the lower lid and the upper cheek. The new temple lift has the cost and convenience advantages of day surgery. For the result to be subtle and harmonious, the corrective surgery should ideally be undertaken before the ageing changes are too advanced.
